AB The present invention provides charge tags for attachment to materials including solid supports and nucleic acids, wherein the charge tags increase or decrease the net charge of the material. Thus, when an oligonucleotide modified with a charge tag is reduced in size (cleaved) or increased in size (elongated), the resulting product bears a net charge or a charge to mass ratio different from the original oligonucleotide thereby permitting sepn. of the original and product oligonucleotides on the basis of charge. The present invention therefore further provides methods for sepg. and

characterizing mols. based on the charge differentials between modified and unmodified materials, e.g., by capillary electrophoresis. Thus, MCP1 and ubiquitin transcripts were simultaneously detected in an in vitro assay using the Invader technol. and probes charge tagged with one of two phosphoramidates, i.e., dG-P-Cy3 or dC-P-Cy3 in which P = -O-P(:O)(NHCH2CH2NMe2)O-.

AB The present invention provides protonated compds. X-Y-Z (Y = O, P, C; X, Z = end blocking groups preventing degrdn. of the mol. and providing stability) having **antimicrobial** activity and a sanitizing compn. comprising a protonated compd. and a metal salt of a carboxylic acid. The protonated compds. and compns. provide efficacious **antimicrobial** activity against resistant strains of **bacteria** and opportunistic fungi. For example, the s.c. administration of compds. Nu-2, Nu-3, Nu-4, and Nu-5 (12 mg/mL) were effective in attenuating the incidence of infection of burn wounds in a mice model, a ribose deriv. Nu-4 being the most efficacious providing 100% survival.

AB The present invention provides a method of treating **bacterial** respiratory infections by pulmonary administration of protonated/acidified nucleic acids. These modified nucleic acids are effective as **bactericidal** and/or **bacteriostatic** agents without regard to the class of **bacteria**, so are esp. useful when diagnosis is difficult or when multiple infectious organisms are present. The antibiotic activity of nucleic acids of the invention is not dependent on either the specific sequence of the nucleic acid or the length of the nucleic acid mol.

AB An optimized automated synthesizer is presented for assembling oligonucleotides, thiooligonucleotides, and 5'-modified oligonucleotides including chem. phosphorylation, multihydroxyl derivatization with a non-nucleosidic phosphoramidite. The incorporation of biotin, fluorescein, and rhodamine phosphoramidites is described. The purifn. and structure detn. of oligonucleotides was confirmed using HPLC, capillary electrophoresis, and laser desorption mass spectrometry. Several applications and confirming data will be presented for gene synthesis and polymerase chain reaction expts.

AB A method of using a chimeric mol. made up of an antisense oligonucleotide attached to a 2',5'-oligoadenylate mol. to specifically cleave a sense strand of RNA, wherein the antisense oligonucleotide of the chimeric mol. is hybridized to the sense strand of RNA in the presence of 2',5'-dependent RNase is claimed. Chimeric 2',5'-oligoA-antisense oligonucleotides were synthesized and tested in vitro and in vivo. The chimeric mol. caused sequence-specific cleavage. The 2',5'-oligoA moiety enhanced the ability of antisense oligonucleotides to inhibit specific gene expression. When administered to mammalian cells, destruction of specific RNA mols. occurred without having to treat the cells in any special way in order to get the chimeric mols. into the cell.

AB Oligodeoxynucleotide conjugates of netropsin (Nt) and distamycin A (Dst) were synthesized, and the thermal stability of several model DNA duplexes contg. conjugates was studied. Two Dst residues conjugated at both ends of the oligodeoxynucleotide were needed for substantial increase in the melting temp. of the corresponding duplex (.DELTA.Tm > 30.degree.). Two attached Dst residues had a greater effect on the Tm value than did two free mols. of Dst per duplex. In contrast to Dst, one Nt mol. linked to the oligonucleotide was enough to influence the thermal stability of the duplexes. Like Dst, the attached Nt appeared to stabilize duplexes much more than free Nt mols. Attachment of Nt to either the 5'- or 3'-end of the different nonadeoxynucleotides contg. 5'...TTAAA... or 5'... TATA sites increased Tm of their duplexes by 21.degree.-25.degree., whereas .DELTA.Tm for free Nt was 8.degree.-15.degree. (.DELTA..DELTA.Tm = 10.degree.-14.degree.). The same phenomenon was shown for oligonucleotide phosphorothioates (.DELTA.Tm were 18.degree.-22.degree. and 9.degree.-13.degree. for attached and free Nt, resp.; .DELTA..DELTA.Tm = 9.degree.). This effect was even more pronounced for a hairpin oligonucleotide (.DELTA..DELTA.Tm = 18.degree.).

AB Oligonucleotide analogs with N3' .fwdarw. P5' phosphoramidate linkages bind to the major groove of double-helical DNA at specific oligopurine-oligopyrimidine sequences. These triple-helical complexes are much more stable than those formed by oligonucleotides with natural phosphodiester linkages. Oligonucleotide phosphoramidates contg. thymine and cytosine or thymine, cytosine, and guanine bind strongly to the polypurine tract of human immunodeficiency virus proviral DNA under physiol. conditions. Site-specific cleavage by the Dra I restriction enzyme at the 5' end of the polypurine sequence was inhibited by triplex formation. A eukaryotic transcription assay was used to investigate the effect of oligophosphoramidate binding to the polypurine tract sequence on transcription of the type 1 human immunodeficiency virus nef gene under the control of a cytomegalovirus promoter. An efficient arrest of RNA polymerase II was obsd. at the specific triplex site at submicromolar concns.

I

AB Nucleic acid probes for sensing a DNA or RNA mol. The probe I comprises (a) an oligodeoxyribonucleotide or oligodeoxyribonucleotide portion consisting of a DNA or RNA nucleic acid sequence (S) depending of the kind of mol. to be sensed, and (b) a non-nucleotide portion having chem. properties enabling the direct or indirect attachment of one or more detection units or biotin labeling elements (M) that are non-isotopically detectable by oligodeoxyribonucleotide. of color or light, and chem. arm (L), with x, x1, z, z1 are > or equal to zero, y and y1 are never both equal to zero. The probe is characterized in that portion (b) consists of a chain of phosphate units between which are inserted alkyl units, i.e. (b1) a no. of alkyl units joining the various phosphate groups and having no particular functionality, and (b2) alkyl units having primary amine functions enabling coupling to various reagents and thus direct or indirect detection, units (b2) being bound to portion (a) or sequence (S) via units (b1). Sequence (S) is linked at its 5' and/or 3' end ot one or more labeling elements (M). Such probes are useful for sensing and diagnosing hereditary genetic diseases, oncogenes, and viral, **bacterial** or parasitic diseases.

AB The synthesis and enzymic characterization of 5'-O-[4-(2,4-dinitrophenylamino)butyl]phosphoryluridylyl-(3'.fwdarw.5')-2'-deoxyadenosine-3'-[N-[(2-aminobenzoyl)aminoprop-3-yl]phosphate] (DUPAAA), a novel fluorogenic substrate for pancreatic-type RNases is described. It consists of the dinucleotide, uridylyl-3',5'-deoxyadenosine, to which a fluorophore, o-aminobenzoic acid, and a quencher, 2,4-dinitroaniline, have been attached by means of phosphodiester linkages. Due to intramol. quenching, the intact substrate displayed very little fluorescence. Cleavage of the phosphodiester bond at the 3'-side of the uridylyl residue by RNase caused a 60-fold increase in fluorescence. This allowed the continuous and highly sensitive monitoring of enzyme activity. The substrate was turned over efficiently by RNases of the pancreatic type, but no cleavage was obsd. with **microbial** RNase T1. Compared to the dinucleotide substrate, UpA, the specificity const. with RNase A, RNase PL3, and RNase Us increased 6-, 18-, and 29-fold, resp. These differences in increased catalytic efficiency most likely reflect differences in the importance of subsites on the enzyme in the binding of elongated substrates. Studies on the interactions of RNase inhibitor with RNase A using DUPAAA as a reporter substrate showed that it was well suited for monitoring this very tight protein-protein interaction using pre-steady-state kinetic methods.

AB A technique of highly selective affinity labeling, which includes covalent modification of the enzyme-T7A2 promoter complex with reactive oligonucleotide derivs. and subsequent elongation of the attached oligonucleotide residue with a radioactive substrate, was used to study the product-binding site of Escherichia coli RNA polymerase. Different oligonucleotides complementary to the T7A2 promoter (with lengths of 2-8 residues) contg. 5'-terminal phosphorylating, alkylating, or aldehyde groups were used for labeling. The procedure resulted in labeling DNA and .beta., .beta.', or .sigma. subunits of the enzyme, which are therefore believed to contact growing RNA in the course of initiation. Consideration of the labeling patterns as a function of oligonucleotide length as well as of the structure and chem. specificity of the reactive groups led to a tentative topog. scheme of the RNA polymerase product-binding region.

AB The DNA strand cleavage reaction catalyzed by endonuclease III from E. coli (endo III) on the 3'-side of aldehydic abasic sites proceeds by a syn .beta.-elimination involving abstraction of the 2'-pro-S proton and formation of a trans .alpha.,.beta.-unsatd. aldose product; the same stereochem. course was previously reported for the reaction catalyzed by UV endonuclease V from **bacteriophage** T4 (UV endo V). Since UV endo V does not contain a 4Fe-4S center, the 4Fe-4S center present in endo III need not be assigned a unique role in the .beta.-elimination reaction. The .beta.-elimination reactions that occur under alk. conditions (0.1 N NaOH) and in the presence of the tripeptide Lys-Trp-Lys proceed by anti .beta.-elimination mechanisms involving abstraction of the 2'-pro-R proton and formation of a trans .alpha.,.beta.-unsatd. aldose product. The different stereochem. outcomes of the enzymic and nonenzymic .beta.-elimination reactions support the hypothesis that the enzyme-catalyzed reactions may involve general-base-catalyzed abstraction of the 2'-pro-S proton by the internucleotidic phosphodiester leaving group.

AB The synthetic heptameric heteroduplex of d(GCGDGCG) paired with d(CGCACGC), where D is the deoxyribose abasic site, was a substrate for UV-endonuclease (endonuclease V) from phage T4. The structure of the product contg. the carbohydrate derived from the abasic site was established using a heteroduplex in which the abasic site was labeled with 13C in the 1- and 3-C atoms. The 13C NMR spectra of the endonuclease-catalyzed reaction as a function of time revealed that the endonuclease catalyzes a .beta.-elimination reaction to yield an .alpha.,.beta.-unsatd. aldehyde; this product subsequently undergoes the slow addn. of nucleophiles present in the reaction soln. to yield mixts. of 3-C adducts.

AB The self-complementary octanucleotide, dT-A-G-T-A-C-T-A, was synthesized and its sequence confirmed by 2-dimensional fingerprinting. Under conditions used for the phage T4 polynucleotide ligase reaction, this oligonucleotide forms a dimeric duplex which shows a Tm of 18.degree.. The optimal rate of joining of the 32P-labeled duplex occurs between 12 and 15.degree.. The rate is highly concn.-dependent, as expected for a bimol. process. Polyacrylamide gel electrophoretic anal. of this reaction shows the presence of products up to 120 nucleotides in length. In a denaturing gel, each product appears as double band due to the presence of its 5'-adenylylated activated intermediate. Substrates >8 base pairs are utilized more rapidly than the 8 base pair duplex, indicating that the T4 ligase has a higher affinity for longer substrates. The low level of nicked intermediates suggests that the joining of both strands requires 2 steps, the rates of which must be similar.

AB The title compd. (I) was obtained in 7% yield by condensation of 2'-O-tetrahydropyranyluridylyl-(3' .fwdarw. 5')-2',3'-O-ethoxymethyleneuridine (II) and 5'-O-phosphono-2'-O-tetrahydropyranyluridylyl-(3' .fwdarw. 5')-2',3'-O-

ethoxymethyleneuridine (III) in the presence of 2,4,6-iso-Pr3C6H2SO2Cl. II was prepd. from 2'-O-tetrahydropyranyl-5'-O-acetyluridine 3'-phosphate and 2',3'-O-ethoxymethyleneuridine by the N,N'-dicyclohexylcarbodiimide method, and III was obtained by phosphorylation of II. The priming activity of I, estd. in the polymn. of ADP by primer-dependent polynucleotide phosphorylase (IV), was almost double that of uridylyl-(3' .fwdarw. 5')-uridine. Participation of both portions of the mol. contg. internucleotide linkage in the interaction with the enzyme accounted for this increased activity. I also primed the reaction of IDP and IV in the presence of ribonuclease T1 yielding 3'-IMP and 3'-O-phosphorylinosinyl-(5' .fwdarw. 3')-uridylyl-(5' .fwdarw. 3')-uridylyl-(5' .fwdarw. 5')-uridylyl-(3' .fwdarw. 5')-uridylyl-(4' .fwdarw. 5')-inosine 3'-phosphate, which was degraded by **bacterial** alk. phosphatase and pancreatic ribonuclease to yield 3'-O-phosphoryluridylyl-(5' .fwdarw. 5')-uridine 3'-phosphate, inosine, and 3'-UMP approx. in the ratio 1:2:2.

AB High mol. wt. deoxyribopolynucleotides with repeating nucleotide sequences were previously shown to direct the synthesis of polypeptides in the **bacterial** cell-free protein synthesizing system. With the aim of synthesizing polypeptides contg. specific amino acid sequences via nucleic acid templates, a deoxyribododecanu-cleotide was now synthesized. The synthetic polynucleotide, d-A-T-G-C-A-C-T-C-T-T-A-G, contains at the appropriate 5' end the trinucleotide sequence A-T-G, which stands for formylmethionine and initiates the synthesis of peptide chain, and at the 3' end the sequence T-A-G, which should terminate and release the polypeptide chain. The codons selected for internal positions were C-A-C (histidine) and T-C-T (serine). The protected trinucleotide blocks d-MMTr-ABZpTpGiso-Bu, d-pCAnpABzpCAn-OAc, d-pTpCAnpT-OAc, and d-pTpABzpGiso-Bu-OAc were prepd. by stepwise methods using the protected nucleoside and nucleotides. The blockwise condensations of the protected trinucleotides to form the dodecanucleotide were carried out using mesitylenesulfonyl chloride as the condensing agent, yields in the individual steps being 30-50%.

LINE COUNT:	1406

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides protonated compounds having antimicrobial activity. The invention also provides antimicrobial compositions comprising protonated compounds of the invention. The protonated compounds of the invention provide efficacious antimicrobial activity against resistant strains of bacteria and opportunistic fungi.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L14 ANSWER 2 OF 5 USPATFULL

ACCESSION NUMBER:	2001:48036 USPATFULL
TITLE:	Pulmonary delivery of protonated/acidified nucleic acids
INVENTOR(S):	Dale, Roderic M. K., Wilsonville, OR, United States Gatton, Steven L., Lake Oswego, OR, United States Arrow, Amy, Bethel, ME, United States
PATENT ASSIGNEE(S):	Oligos Etc. Inc., Wilsonville, OR, United States (U.S. corporation)

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides a method of treating bacterial respiratory infections by pulmonary administration of protonated/acidified nucleic acids. These modified nucleic acids are effective as bactericidal and/or bacteriostatic agents without regard to the class of bacteria, so are especially useful when diagnosis is difficult or when multiple infectious organisms are present. The antibiotic activity of nucleic acids of the invention is not dependent on either the specific sequence of the nucleic acid or the length of the nucleic acid molecule.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L14 ANSWER 3 OF 5 USPATFULL

ACCESSION NUMBER:	1999:128744 USPATFULL		
TITLE:	Nucleic acid probes chemically modified at 5'(OH) and/or at 3'(OH) for the purpose of introducing one or more non-radioactive marking elements at these sites, and method for preparing the same		
INVENTOR(S):	De Vos, Marie-Joelle, Feluy, Belgium Bollen, Alex, Itterbeek, Belgium

LINE COUNT:	1681	

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The probe comprises: a) an oligonucleotide or oligodeoxyribonucleotide part constituted by a DNA or RNA nucleic acid sequence S, depending on the type of molecule to be detected, and b) a non-nucleotide part possessing chemical properties enabling direct or indirect atttachment of one or more detection units or marking elements M detectable non-isotopically by production of colour or light. The probe is characterized by the fact that part b) is constituted by a chain of phosphate units interspersed with alkyl groups, viz.: b1) certain alkyl groups uniting the different phosphate groups and presenting no special functionality b2) alkyl groups presenting primary amine groups which allow splicing with varied reagents to carry out direct or indirect detection, the b2) groups being bonded to part a) or sequence S by way of groups b1). Sequence S is bonded at its 5' and/or 3' extremity to one or more marking elements M. The probes of this type are used to detect and diagnose hereditary genetic diseases, oncogenes, viral, bacterial or parasitic diseases.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L14 ANSWER 4 OF 5 USPATFULL

ACCESSION NUMBER:	97:14599 USPATFULL			
TITLE:	Improvements in or relating to DNA cloning techniques and products for use therewith			
INVENTOR(S):	Taylor, Philip N., Nr Dartford, United Kingdom

LINE COUNT:	873			

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A method of cloning foreign DNA into a DNA vector comprising ligating:

(1) a DNA vector having a single stranded DNA overhang at each end, said overhangs being mutually incompatible so as to prevent self-religation, with

(2) a linear piece of foreign DNA having a single stranded DNA

overhang at each end,

each foreign DNA overhang being complementary to but at least one base shorter than each of the vector overhangs and being capable of base pairing along the entire length of the overhang with one of the vector overhangs, and sealing the gap by either transforming the double stranded DNA having a gap therein into a suitable bacterium or transfecting it into a suitable bacterium after packaging it into a suitable bacteriophage.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L14 ANSWER 5 OF 5 USPATFULL

ACCESSION NUMBER:	96:113828 USPATFULL
TITLE:	Method of cleaving specific strands of RNA
